

## **Eni receives Gold Standard recognition from United Nations for commitment to reducing methane emissions**

*San Donato Milanese, December 1 2023* - Eni announces that it has received a Gold Standard within the Oil and Gas Methane Partnership 2.0 (OGMP 2.0) program as reported today in [the International Methane Emissions Observatory \(IMEO\)](#) published by the United Nations Environment Programme (UNEP).

The recognition by the United Nations is based on Eni's positive assessment for its significantly improved implementation plan for methane emissions reporting, conforming to the OGMP 2.0 recommendations.

This award by the United Nations marks the effectiveness of Eni's decarbonisation strategy, with reference to reducing methane emissions, an issue that has taken a key role in the international climate debate.

Eni confirms the stability of Upstream methane emission intensity below 0.2 % in line with the Oil and Gas Climate Initiative (OGCI) "well below 0.2 %" target by 2025. Eni has already achieved this target continuing to focus on reducing fugitive emissions and through projects of methane abatement from venting and flaring. In 2022 this value stood at 0.08%.

Eni reduced methane emissions by more than 50% in 2022 compared to 2018, largely due to the implementation of LDAR (Leak Detection And Repair) programs in almost all Eni-operated assets.

In 2022, Eni contributed to the launch of [the Aiming for zero methane emissions](#) initiative with OGCI, which now has more than 90 member companies. To ensure increasing transparency in the reporting of methane emissions, Eni is implementing a measurement plan on the sites where it operates using the best technologies available on the market, in line with the international guidelines shared in the OGMP 2.0 program. This initiative will also enable Eni to set a new emissions reduction target in 2024.

Eni's commitment to reducing methane emissions is one of the levers of company's decarbonisation plan for its operations, which also includes the progressive reduction of routine flaring emissions and investments in energy efficiency, with the goal of achieving Net Zero Scope 1+2 emissions for the Upstream business by 2030 and for all of Eni by 2035.
